ABSTRACT OF THE DISCLOSURE

An apparatus of a modular system interface is provided. The apparatus and method utilize a main panel that is configured to be attached to a rack and includes at least one cut-out. At least one sub-panel is configured to be attachable to the main panel across the cut-out, and the at least one sub-panel supports a predetermined connector. The present invention can also be viewed as providing a method for a modular system interface. In this regard, the method can be broadly summarized by the steps of providing a main panel configured to be attachable to a rack and including at least one cut-out, and providing at least one sub-panel configured to be attachable to the main panel across the cut-out, wherein the at least one sub-panel supports a predetermined connector.
